by disulphide bridges. The new derivatives are illust and the deliver active disulphide bridge. The novel derivatives are used to deliver active agents to an organism, e.g. therapeutic proteins, antibodies (or their fragments), nucleic acid, oligonucleotides, ribozymes, antitumour agents, antivirals and anti-inflammatories, etc. The derivatives are non-toxic and non-lytic but can cross mammalian cell membranes rapidly by a passive mechanism, so can deliver active agents to cytoplasm and nucleus, including crossing the blood-brain barrier.
                            This peptide represents a linear derivative of the protegrin family of peptide antibiotics. Protegrin antibiotics form part of the peptide antibiotic family which contain a beta-sheet secondary structure linked by disulphide bridges. The new derivatives are linear and lack the

By using the peptide as a vector for delivery of the anticancer agent, mechanisms that cause cancer cells to become resistant to the agent, methalisms the P-glycoprotein pump, are avoided. Also, peptides are easily produced by chemical synthesis, can be coupled easily to the agent, cross ammanian cell membranes rapidly by a passive mechanism (no receptors required), and are non-toxic and non-lytic. The compositions are used to treat cancer. The present sequence represents a peptide which may be linked to the anticancer agents of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                       New composition useful for cancer treatment and prevention, contains anticancer agent and peptide vector that transports agent into cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

RESULT

This peptide represents a linear derivative of the protegrin family of peptide antibiotics. Protegrin antibiotics form part of the peptide antibiotic family wheih contain a beta-sheet secondary structure linked by disulphide bridges. The new derivatives are linear and lack the disulphide bridge. The novel derivatives are used to deliver active agents to an organism, e.g. therapeutic proteins, antibodies (or their fragments), nucleic acid, oligonucleotides, ribozymes, antitumour agents, antivirals and anti-inflammatories, etc. The derivatives are non-toxic and non-lytic but can cross mammalian cell membranes rapidly by a passive including crossing the blood-brain barrier.

Protegrin antibiotics form part of the peptide antibiotic family which contain a beta-sheet secondary structure linked by disulphide bridges. The new derivatives are linear and lack the disulphide bridge. The novel derivatives are linear and lack the agents to an organism. e.g. therapeutic proteins, antibodies (or their fragments), nucleic acid, oligonuclectides, ribozymes, antitumour agents, antivirals and anti-inflammatories, etc. The derivatives are non-toxic and non-lytic but can cross mammalian cell membranes rapidly by a passive mechanism, so can deliver active agents to cytoplasm and nucleus,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Cytostatic; neurodegenerative; antidepressant; analgesic; antimicrobial; blood-brain barrier; diagnostic; central nervous system; protegrin; Antennapedia; tachyplesin; peptide antibiotic; Alzheimer's disease; cancer; Parkinson's disease; depression; pain; meningitis.

The invention relates to the use of linear peptides, coupled to an active agent, to prepare a composition able the cross the blood-brain barrier for diagnosis or treatment of disorders localised in the central nervous system. The linear peptide preferably has the formula: (a) X1-X16; (b); BXXBXXXXBBXXXXBBXB, where: each of X1-X16 are amino acids (aa), of which 6-10 of them are hydrophobic and X6 must correct forms of (a)-(c) of them are hydrophobic and X6 must be Trp; each B is aa containing a side chain that includes a basic group; and each X is an aliphatic or aromatic aa. The linear peptide may be certo forms of (a)-(c) containing D- and/or L-form aa, or a fragment containing at least 5, preferably at least 7 consecutive as from (a)-(c). Peptides able to cross the BBB include protegrins, Antennapedia, tansportan, etc. of these several families have cytolytic effects and are termed peptide antibiotics. They fall into 3 main categories based on their structure: (i) peptides with alpha-helices, beta-sheets, e.g. protegrin, tachyplesins, defensins; (iii) peptides with disulphide bond-linked beta-sheets, e.g. protegrin, tachyplesins, defensins; (iii) peptides with no major structure but containing bends due to the presence of with no major structure but containing bends due to the presence of containing and pagalons in the peptides are based on the Antennapedia family peptides; (b)-peptides are based on the Antennapedia family peptides; (b)-peptides are based on the BBB and is conjugated to a doxorublein molecule by a succinate container. The peptide may also be linked to a benzylpenicillin molecule
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Conjugates of the linear peptides and the active agent are particularly used to treat, prevent or diagnose brain cancer, Alzheimer's or trastrinson's diseases, depression, pain and meningitis, but also for studying drug behaviour in BBB models.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

The specification describes a pharmaceutical composition, which comprises at least one anticancer agent associated with at least one peptide that can transport it into cancer cells and which inhibits development of resistance to the anticancer agent. By using the peptide as a vector for delivery of the anticancer agent, mechanisms that cause cancer cells to become resistant to the agent, particularly produced by chemical synthesis, can be coupled easily to the agent, cross mammalian cell membranes rapidly by a passive mechanism (no receptors required), and are non-toxic and non-lytic. The compositions are used to treat cancer. The present sequence represents a peptide which may be linked to the anticancer agents of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New composition useful for cancer treatment and prevention, contains anticancer agent and peptide vector that transports agent into cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Anticancer agent; cancer cell; resistance; P-glycoprotein pump;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                            New peptides are disclosed which are designated "protegrins". The peptides are useful as antibacterial, antiviral and antifungal agents in both animals and plants. The peptides are 16-18 amino acids in length and are characterised by four invariant Cys residues at positions 6, 8, 13 and 15 and either (1) by a characteristic pattern of basic and hydrophobic amino acids and/or (2) being isolatable from animal (e.g. porcine) leukocytes; or analogues of these peptides in which 1-4 of the Cys residues is/are replaced by hydrophobic or small amino acids. The peptides can be produced synthetically and some can be produced recombinantly or can be isolated and purified from thair native sources. The peptides can be modified by N-acylation and/or C-terminal amidation or esterification, and can be in linear or cystine-bridged form. D-Amino and residues can be present.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Galectin; Galectin-3; cell growth; tumour; metastasis; cirrhotic liver; hepatocellular carcinoma; liver neoplasm.

AAB30440-85 represent peptides derived from galectin family members. Galectin-3 has been associated with assorted processes such as cell growth, tumour transformation, and metastasis. It is composed of two domains: a carbohydrate-binding region on the carboxy terminal which binds saccarides with terminal galactose residues, and an amino terminal domain consisting of tandem repeats of nine amino acids. The expression of galectin-3 is induced in cirrhotic liver and hepatocellular carcinoma, and so is useful as a marker of cirrhotic liver and hepatocellular carcinoma. Galectin-3 is used in diagnostic, prognostic and therapeutics for the treatment and prevention of hepatocellular carcinoma. It is useful for determining whether an individual is suffering from hepatocellular carcinoma or is likely to suffer from hepatocellular carcinoma or any neoplasm of liver origin or cirrhosis of the liver in the future.
                                                                                                                                                                                                                                                                           Cirrhotic liver and hepatocellular carcinoma marker galectin-3, useful in diagnostic, prognostic and therapeutic methods for treating and preventing hepatocellular carcinoma -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Phosphorylase kinase gamma subunit; replacement therapy; glycogen utilisation disorder; muscle glycogenosis; hypoglycaemia;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents a novel human phosphorylase kinase gamma subunit, characterised as having homology to other phosphorylase kinase gubunit, characterised as having homology to other phosphorylase kinase gamma subunits. Recombinant human phosphorylase gamma subunit is useful for replacement therapy in cases of glycogen utilisation disorders.

To fine the sequence of a sequence of glycogen utilisation disorders.

Transformed with the DNA encoding the present sequence can also be used to screen for modulators of human phosphorylase kinase gamma subunit activity, i.e. potential therapeutic agents. The protein can also be used to superess mutant forms of the this gene. The protein can be used to superess mutant forms of the this gene. The protein can be used to raise specific antibodies, useful as immunoassay reagents.

Tragments of the DNA encoding the present sequence can be used dagnostically, e.g. to detect or quantify gene expression, to isolate genes or related nucleic acid, to detect activation/induction of human property of the protein acid, to detect activation/induction of human contains and the protein acid, to detect activation/induction of human contains and the protein acid, to detect activation/induction of human contains and contains 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Phosphorylase kinase gamma subunit: HPHKG; human; treatment; glycogen; pathophysiological condition; phosphorylase kinase; PHK; hypoglycemia; muscle glycogenosis; atrophy; metabolic abnormality; growth; diagnosis; kidney dysfunction; failure; drug screening.

HPHKG. The polypeptides and nucleic acids encoding them can be used for treating pathophysiological conditions caused by aberrant forms of phosphorylase kinase (PHK) and by deficiencies in PHK activity. They can utilisation and consequent glucose depletion, e.g. muscle glycogen utilisation and consequent glucose depletion, e.g. muscle glycogenosis, involving muscular weakness and atrophy, and hypoglycemia, which may lead dysfunction or failure. The products can also be used for antibody production, detection, diagnosis and drug screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Phosphorylase kinase; gamma subunit; glycogen; calcium dependent; catabolism; glucose; mobilisation; glycogen phosphorylase; GP; regulation; phosphorylation; activation; genetic heterogeneity; muscle; liver; hepatic; glycogenosis; deficiency; disease; exercise intolerance; weakness; muscular atrophy; hypoglycaemia; hepatomegaly; antibody;

                                                                                                                                                                                                                                This Sequence represents a movel gamme subunit or prospers. Affasse (Phk). Phk regulates glycogen phosphorylase (GP), which is responsible for the catabolic breakdown of glycogen to glucose. Phk phosphorylates GP, thereby activating it, leading to mobilisation of glucose reserves for ATP production. Phk consists of 4 different subunits: regulatory alpha and beta subunits, calmodulin (delta subunit) and the catalytic gamma subunit. Since the enzyme is composed of 4 on-identical subunits, Phk deficiency has significant potential for genetic heterogeneity. Muscle glycogenosis caused by Phk deficiency leads to exercise intolerance, weakness and muscular atrophy. Hepatic phk deficiency is also associated with certain hepatic diseases characterised by hypoglycaemia and hepatomegaly. This Phk gamma subunit or enzymatically active fragments thereof may be used to raise pathophysiological conditions caused by aberrant forms of Phk, and deficiencies in Phk activity. Prior art treatment for Phk deficiency—control of the catabod deficiency—control of the c

```
apoptosis inducing kinase) having apoptosis inducing activity. The kinases can be expressed recombinantly by transforming host cells with vectors comprising the nucleic acids encoding the kinases. The kinases are useful in the treatment, prevention, diagnosis and investigation of diseases with which apoptosis is associated, such as hormonally regulated cancer (such as breast cancer, ovarian cancer, lymphoma); autolimune diseases; viral infections (such as heroes, adenovirus, poxvirus, HIV); Alzheimer's disease; Parkinson's disease; arteriosciarosis; alcoholism; rheumatoid arthritis; and diabetes. The present sequence represents the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; mouse; protein kinase; antiarthritic; antisclerotic; osteopathic; immunosuppressive; cardiant; renal; antinflammatory; antiasthmatic; dermatchogical; antidabetic; antinfertility; gene therapy; vaccine; immune disorder; cardiovascular disease; neurodegenerative disease; cancer; autoimmune disorder; stroke; inflammatory bowel disease; inflammatory pelvic disease; multiple sclerosis; psoriasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Nucleic acids encoding kinase polypeptides, useful for diagnosing and treating immune-related diseases and disorders, cardiovascular disease,

                                                  The present sequence is a novel protein kinase. The novel protein kinases and the nucleic acids that encode them may be used in the treatment and diagnosis of diseases associated with inappropriate kinase expression such as immune-related diseases and disorders, cardiovascular disease, neurodegenerative diseases and/or cancers. The nucleic acids and complementary sequences may also be used as DNA probes in diagnostic assays. The kinase polypeptides may be used as antigons in the production of antibodies of kinase expression and activity. Diseases related to kinase antibodies and kinase antagonists may also be used to down regulate kinase carprists may also be used to down regulate kinase activity include rheumatoid arthrifis, atherosclerosis, autoimmune activity include rheumatoid arthrifis, atherosclerosis, autoimmune consorters, candiomyopathies, strokes, renal failure, immune disorders, cardiomyopathies, strokes, renal failure, chica inflammatory pelvic disease, multiple sclerosis, asthma.
                                                                                                                                                                                                                                                                                                                                                                                                          ;

The present sequence is an antimicrobial protegrin peptide, which has a broad spectrum of activity against microbial targets, including gram positive and gram-negative bacteria, yeast, fung, protozoa and certain strains of viruses and retroviruses, e.g. HIV.

It can be used to preserve or disinfect a variety of materials, including medical equipment, foodstuffs, cosmedics, contact lens solutions, medicaments or other nutrient containing materials. It can also be used for the prophylaxis or treatment of microbial infections or diseases in plants and animals, e.g. conjunctivitis, keratitis, corneal ulcers, stomach ulcers associated with elicobacter pylori, sexually transmitted diseases, gram-negative sepsis, endocatitis, pneumonia and other respiratory infections, systemic candidiasis and oral mucositis. It is biostatic or biocidal against clinically relevant pathogens of exhibiting multi-drug resistance, e.g. vancomyoin resistant staphylococcus streptococcus faectium or faecalis, penicillin resistant Staphylococcus caries (MRSA). It is given at a dosage of 0.1 to 5, preferably 0.5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        0; Gaps

                                                                                                                      -i- FUNCTION: CATESTATIN INHIBITS CATECHOLAMINE RELEASE FROM
CHROMAFEIN CELLS AND NORADRENERGIC NEURONS BY ACTING AS A NON-
COMPETITIVE NICOTINIC CHOLINERGIC ANTAGONIST.

-i- FUNCTION: VASOSTATIN-I HAS ANTIBACTERIAL ACTIVITY AGAINST GRAM-
POSITIVE BACTERIA M.LUTEUS, B.GBATERIUM. NOT ACTIVE AGAINST GRAM-
POSITIVE BACTERIA B.CEREUS, B.GBATERILIS, S.PROGENES, M.FORTUTUM,
S.AUREUS AND L.MONOCYTOGENES AND AGAINST GRAM-
B.COLI, E.CLOACAE, S.TYPHIMURIUM, K.PNEUMONIAE AND P.AURUGINOSA.
POSISSES ANTIFUNGAL ACTIVITY AGAINST N.CRASSA, A.EUMIGATUS,
A.BRASSICOLA, N. HEMATOCOCCA, F. CULMORUM AND F. OXYPORUM AND
AGAINST S.CEREVASSA, A. TOMENTOR AGAINST
M. MENNEN, D. C. CLEREVASSE AND C. ALBICANS YEAST. INACTIVE AGAINST
heterogeneities by mass spectrometry.";
Anal. Biochem. 274:69-80(1999).
-!- FUNTION: PANCREASTATIN STRONGLY INHIBITS GLUCOSE INDUCED INSULIN
                                                            -1- FUNCTION: CHROMOSTATIN COMPLETELY INHIBITS CATECHOLAMINE RELEASE FROM CHROMAFFIN CELLS.
                                                                                                                                                                                                                                                                                                                                                MASS SPECTROMETRY: WW-8584.9; METHOD-MALDI; RANGE=19-94.
MISCELLANEOUS: BINDS CALCIUM WITH A LOW-AFFINITY.
SIMILARITY: BELONGS TO THE CHROMOGRANIN / SECRETOGRANIN PROTEIN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Phosphorylation;

Chromogranin A precursor [validated] - bovine
N;Alternate names: pituitary secretory protein I; secretory protein I
N;Contains: chromostatin; pancreastatin
C;Species: Bos primigenius taurus (catile)
C;Species: Bos primigenius taurus (catile)
C;Date: 10-Sep-1999 #sequence_revision 10-Sep-1999 #text_change 18-Aug-2000
C;Accession: A41520, A28033, A24175; A60306; A61114; S15847; S39016; I46008; S38976
R;Riacangelo, A.L.; Grimes, M.; Eiden, L.E.
Mol. Endocrinol. 5, 1651-1660, 1991
A;Title: The bovine chromogranin A gene: structural basis for hormone regulation an A;Reference number: A41520; MUID: 92140395
A;Status: not compared with conceptual translation

                                                                                                                                                                                                                                                                                                                 RESULT 11

S42980
viral infectivity factor vif - human immunodeficiency virus type 1
C; Species: human immunodeficiency virus type 1, HIV-1
C; Species: human immunodeficiency virus type 1, HIV-1
C; Date: 06-Feb-1995 #sequence_revision 06-Feb-1995 #text_change 20-Sep-1999
C; Accession: 842980
R; Wieland, U; Hartman, J; Suhr, H; Salzberger, B; Eggers, H.J.; Kuehn, J.E. Submitted to the EMBL Data Library, March 1994
A; Bescription: In vivo genetic variability of the HIV-1 gene.
A; Reference number: $42940
A; Accession: $42980
A; Accession: $42980
A; Accession: Dreliminary
A; Molecule type: DNA
A; Residues: 1-192 <ALIED
A; Cross-references: EMBL:230641; NID:9459524; PIDN:CAA83118.1; PID:9459525
C; Superfamily: AIDS vif protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Viral infectivity factor vif - human immunodeficiency virus type 1
C; Species: human immunodeficiency virus type 1, HIV-1

Asylond viral infectivity factor vif - human immunodeficiency virus type 1
C; Species: human immunodeficiency virus type 1
C; Species: human immunodeficiency virus type 1, HIV-1
C; Date: 06-Feb-1995 #sequence_revision 06-Feb-1995 #text_change 20-Sep-1999
C; Accession: S43004
R; Wieland, U.; Hartmann, J.; Suhr, H.; Salzberger, B.; Eggers, H.J.; Kuehn, J.E.
Submitted to the EMBL Data Library, March 1994
A; Description: In vivo genetic variability of the HIV-1 gene.
A; Reference number: S42940
A; Reference number: S43004
A; Status: preliminary
A; Molecule type: DNA
A; Residues: 1-192 <WIE>
A; Residues: L-192 <WIE>
A; Cross-references: EMBL: Z30695; NID:g459627; PIDN:CAA83175.1; PID:g459628
C; Superfamily: AIDS vif protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   RESULT 15

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                               This peptide represents a linear derivative of the protegrin family of peptide antibiotics. Protegrin antibiotics form part of the peptide antibiotic family which contain a beta-sheet secondary structure linked by disulphide bridges. The new derivatives are linear and lack the disulphide bridge. The novel derivatives are used to deliver active agents to an organism, e.g. therapeutic proteins, antibodies for their fragments), nucleic acid, oligonucleotides, ribozymes, antitumour agents, and non-lytic but can cross mammalian cell membranes rapidly by a passive mechanism, so can deliver active agents to cytoplasm and nucleus,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

The present sequence is an antimicrobial protegrin peptide, which has a broad spectrum of activity against microbial targets, including gram-positive and gram-negative bacteria, yeast, fungi, protozoa and certain strains of viruses and retroviruses, e.g. HIV.

It can be used to preserve or disinfect a variety of materials, including medicament, foodstuffs, cosmetics, contact lens solutions, medicament, foodstuffs, cosmetics, contact lens solutions, medicaments or other nutrient containing materials. It can also be used for the prophylaxis or treatment of microbial infections or diseases in plants and animals, e.g. conjunctivitis, keratitis, corneal ulcrers, stomach ulcrers associated with Helicobacter pylori, sexually transmitted diseases, gram-negative sepsis, endocarditis, pneumonia and other respiratory infections, urinary tract infections, systemic candidisals and oral mucositis. It is biostatic or biocidal against clinically relevant pathogens exhibiting multi-drug resistance, e.g. vancomycin resistant clinically relevant pathogens can become or faecalis, penicillin resistant staphylococcus curens (MRSA). It is given at a dosage of 0.1 to 5, preferably 0.5 to 1 mg/kg/day, by injection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                           New antimicrobial protegrin peptide(s) - having activity against bacteria, yeast, fungi, protozoa and certain strains of viruses (e.g. HIV)
